

## Comparison of C and Si

**Similarities:** Due to similar valence shell configuration they have some similarities.

- Both are non-metals.
- Both are abundant in nature.
- Both exhibit tetravalency.
- Both exhibit common oxidation state of + 4
- Both will exhibit allotropy.
- Both will form many similar compounds.
- 

	Carbon	Silicon
Oxides	CO <sub>2</sub>	SiO <sub>2</sub>
Halides	CCl <sub>4</sub>	SiCl <sub>4</sub>
Hydrides	CH <sub>4</sub> , C <sub>2</sub> H <sub>6</sub> , C <sub>3</sub> H <sub>8</sub> , etc.	SiH <sub>4</sub> , Si <sub>2</sub> H <sub>6</sub> , Si <sub>3</sub> H <sub>8</sub> , etc.
Oxyacids	H <sub>2</sub> CO <sub>3</sub> (Carbonic acid) (COOH) <sub>2</sub> (oxalic acid)	H <sub>2</sub> SiO <sub>3</sub> (Silicic acid) H <sub>2</sub> Si <sub>2</sub> O <sub>4</sub> (Silico oxalic acid)

**Differences:** C & Si have some differences due to different (n – 1) shell configuration.

Carbon	Silicon
It is present in living beings.	It is present in minerals, rocks etc.
It is hard.	It is soft.
It has high m.p.	It has low m.p.
Its catenation ability is maximum.	Its catenation ability is limited.
Its maximum valency is 4.	Its maximum valency is 6.
Some allotropes of C are good conductors.	All its allotropes are bad conductors.

Differences in their compounds:	
Oxides	
<p>CO<sub>2</sub> is gas.</p> <p>CO<sub>2</sub> exist as monomer &amp; only weak Vanderwaal's forces exists.</p> <p>In CO<sub>2</sub>, C is bonded to two 'O's by double bonds.</p> $O = C = O$ <p>CO<sub>2</sub> is soluble in water.</p>	<p>SiO<sub>2</sub> is solid.</p> <p>SiO<sub>2</sub> is solid. SiO<sub>2</sub> has giant polymeric structure.</p> <p>In SiO<sub>2</sub>, Si is bonded to four 'O's by single bonds.</p> $\begin{array}{c} \text{O} \\   \\ -\text{O}-\text{Si}-\text{O}- \\   \\ \text{O} \end{array}$ <p>SiO<sub>2</sub> is insoluble in water.</p>

Halides	
<p>It forms CCl<sub>4</sub>.</p> <p>As C does not contain vacant d orbitals in its valence shell, it cannot extend its valency beyond 4.</p>	<p>It forms SiCl<sub>4</sub>.</p> <p>As Si contains vacant d-orbitals in its valence shell it can exhibit a valency of 6.</p>

<p>CCl<sub>4</sub> is saturated.</p> <p>CCl<sub>4</sub> is insoluble in H<sub>2</sub>O.</p> <p>CCl<sub>4</sub> is not hydrolysed.</p> <p>CCl<sub>4</sub> does not form species like CCl<sub>4</sub>.2H<sub>2</sub>O, CCl<sub>6</sub><sup>2-</sup>.</p> <p>CCl<sub>4</sub> cannot act as Lewis acid.</p>	<p>SiCl<sub>4</sub> is unsaturated and it can form two more bonds.</p> <p>It is soluble in H<sub>2</sub>O.</p> <p>SiCl<sub>4</sub> is hydrolysed .</p> <p>It forms species like SiCl<sub>4</sub>.2H<sub>2</sub>O, SiCl<sub>6</sub><sup>2-</sup>.</p> <p>SiCl<sub>4</sub> can act as Lewis acid</p>
---	--

## Hydrides

It forms large number of hydrides.

Its hydrides are stable because C – H bond is non polar & it doesnot weaken the adjacent C – C bond.

Hydrides of C are not hydrolysed due to non-polar nature .

These are weak reducing agents.

It forms very few hydrides.

Silanes are unstable because Si – H bond is slightly polar & it weakens the adjacent Si – Si bond.

They are hydrolysed due to polar nature.

These are strong reducing agents.
